

Basic Terms (dlapa.cz)

IQ Definition:

IQ (intelligence quotient) is the ratio between mental and physical age. It is calculated as:

$$IQ = \frac{\ln(MA + 1)}{\ln(PA + 1)} \cdot 100$$

PA – physical age

MA – mental age

For children, the value of IQ is constant. For adult, the value of IQ is constant or decreasing.

For older people, the threshold of adulthood is taken as the physical age (30). IQ can decrease as a consequence of interception. It is actual decrease but, in some cases, only temporary.

Average IQ:

$$IQ = 100$$

Mental retardation:

$$IQ < 100$$

Exceptional IQ:

$$IQ > 150$$
